A regular polygon is an n-sided polygon in which the sides are all the same length and are symmetrically placed about a common center (i.e., the polygon is both equiangular and equilateral). Only certain regular polygons are "constructible" using the classical Greek tools of the compass and straightedge. The terms equilateral triangle and square refer to the regular 3- and 4-polygons ...

More Complex Polyhedrons. There are many more types of polyhedra: symmetrical and asymmetrical, concave and convex. Archimedean solids, for example, are made up of at least two different regular polygons. The truncated cube (as illustrated) is an Archimedean solid with 14

faces. 6 of the faces are regular octagons and the other 8 are regular (equilateral) triangles.
