Atomic Structure—What We Know Today. For example, all of the sulfur atoms in the pile of sulfur we looked at above have 16 protons in their nucleus. If they had one more proton in their nucleus, they would have a different identity—they'd be chlorine (Cl) atoms, and with one less, they'd be phosphorus (P) atoms.

SparkNotes: SAT Chemistry: Atomic Structure—What We Know Today

So for thinking about the mass of an atom, for all basic purposes, you can ignore the mass of an electron. It's really the mass of the nucleus that counts as the mass of the atom. Now, you might see this periodic table here, and you say, OK, they gave us the atomic number up there.
