The atomic number is the number of protons an atom has. It is characteristic and unique for each element. The atomic mass (also referred to as the atomic weight) is the number of protons and neutrons in an atom. Atoms of an element that have differing numbers of neutrons (but a constant atomic number) are termed isotopes. Isotopes, shown in Figure 1 and Figure 2, can be used to determine the ...

A chemical bond is a lasting attraction between atoms, ions or molecules that enables the formation of chemical compounds. The bond may result from the electrostatic force of attraction between oppositely charged ions as in ionic bonds or through the sharing of electrons as in covalent bonds. The strength of chemical bonds varies considerably; there are "strong bonds" or "primary bonds" such as ...

2.2 Fundamental Concepts. Atoms are composed of electrons, protons, and neutrons. Electron and

protons are negative and positive charges of the same magnitude, 1.6×10^{-19} Coulombs.. The mass of the electron is negligible with respect to those of the proton and the neutron, which form the nucleus of the atom. The unit of mass is an atomic mass unit (amu) = 1.66×10^{-27} kg, and equals $1/12$...

Chapter 2. Atomic Structure and Bonding

Metallic bonding is a type of chemical bonding that rises from the electrostatic attractive force between conduction electrons (in the form of an electron cloud of delocalized electrons) and positively charged metal ions. It may be described as the sharing of free electrons among a structure of positively charged ions ().Metallic bonding accounts for many physical properties of metals, such as ...

Atomic Structure. What is Covalent Bonding?. When non-metals react with non-metals they share electrons and form a covalent bond. Covalent means sharing. If you do not know whether an element is a metal or a non-metal, see the periodic table.. A covalent bond forms because of the electrostatic attraction between the nuclei of the atoms (that are positive) and the shared electrons (that are ...

One measure of size is the element-element distance within the element. It is not always easy to make sensible comparisons between the elements however as some bonds are quite short because of multiple bonding (for instance the O=O distance in O₂ is short because of the the double bond connecting the two atoms. The bond length in H₂ is: 74.130pm.. There are several other ways ways to define ...
