1. Introduction. Biological control is a cornerstone of Integrated Pest Management (IPM) and plays an important role in the sustainable and economic suppression of arthropod pest populations (Bale et al., 2008, Naranjo et al., 2015). The global value of biological control (trophic regulation of populations) has been estimated at \$617/ha (2018 dollars) (Constanza et al., 1997).

Evolution is change in the heritable characteristics of biological populations over successive generations. These characteristics are the expressions of genes that are passed on from parent to offspring during reproduction. Different characteristics tend to exist within any given population as a result of mutation, genetic recombination and other sources of genetic variation.

Asexual reproduction is a form of reproduction in which an organism creates a genetically-similar or identical copy of itself without a contribution of genetic material from another individual. It does not involve meiosis, ploidy reduction, or fertilization, and only one parent is involved genetically. A more stringent definition is agamogenesis, which refers to reproduction without the fusion ...
