Lab Day 3. Using the jars that contain the soil samples and water from Lab Day 2, place a piece of white paper behind each jar and observe the layers. On the outside of the jar, label each layer with the grease pencil. Use the control samples of sand and clay for comparison to identify the layer types. See Figure 4.

### **Testing Soil Productivity Lab - AP Environmental Science ...**

The Silty Clay was the first soil material that we tested which was the sample from near our houses. This turned out to be a mixture of sand, silt, and clay that allowed for a middle range level of permeability when we did the water test.

### **Soil Lab - Brooke's Lab Reports - AP Environmental Science**

This lab has many applications to the real world, mainly in agriculture and construction. Knowing the soil composition of the ground allows agriculture to be more successful. This lab proved that certain soil compositions retain more water than others, for example, clay retains much more water than sandy soil.

### **Soil Lab - APES Labs**

These factors most likely led to a skew in the calculated, average net primary productivity of fescue grass. Making revisions to the Net Primary Productivity Lab would yield more accurate results in future replications of the experiment. In conclusion, net primary productivity is an important indicator of the health of an ecosystem.

### **NPP Lab - AP Environmental Science Labs**

The pH test resulted in a pH 7, which was neutral. When we did the soil type test with the flow chart, the soil formed a ball but when it was squeezed, it did not make a ribbon and the soil type resulted in loamy sand. When we did the soil type test with the jar, the sediment settled quickly after we shook it up and it was a large amount of sand.
