## CHAPTER VECTOR MECHANICS FOR ENGINEERS: 15DYNAMICS

Statics is the branch of mechanics that is concerned with the analysis of loads (force and torque, or "moment") acting on physical systems that do not experience an acceleration ( $a=0$ ), but rather, are in static equilibrium with their environment. When in static equilibrium, the acceleration of the system is zero and the system is either at rest, or its center of mass moves at constant velocity.

In continuum mechanics, stress is a physical quantity that expresses the internal forces that neighbouring particles of a continuous material exert on each other, while strain is the measure of the deformation of the material which is not a physical quantity. For example, when a solid vertical bar is supporting an overhead weight, each particle in the bar pushes on the particles immediately ...

De facto, sempre que dois objetos diferentes entram em contato muito próximo, passam eletrões dos átomos de um dos objetos para o outro. O objeto que for mais susceptível a perder eletrões ficará eletrizado com carga positiva (n protões a mais) e o objeto que for menos susceptível a perder os seus eletrões ficará com a mesma carga, mas negativa (n eletrões a mais).
