Place weights into a boat and see how far the boat sinks into a tank of liquid. The depth of the boat can be measured, as well as the amount of liquid displaced. The dimensions of the boat and the density of the liquid can be adjusted. See how much weight the boat can hold before it sinks to the bottom!

Well, all I wanted to ask is if any of YOU guys have any theories or w/e to prove the Archimedes Principle wrong? By the way, the principle is that an object immersed in a fluid is buoyed up by a force equal to the weight of the displaced fluid. For instance, if you put maybe 30 washers in a container in a bowl of water filled up to the top then the water will spill down right?

Archimedes Principle Worksheet Answers More than 2,000 years ago, Archimedes discovered the relationship between buoyant force and how much fluid is displaced by an object. Archimedes principle states: The buoyant force acting on an object in a fluid is equal to the weight of the fluid displaced by the object.

Get the Gizmo ready: Click Reset. Introduction: Over 2,000 years ago, the Greek mathematician Archimedes discovered that an object in water is pushed up by a force equal to the weight of the displaced water. This law, called Archimedes' principle, has two consequences: If an object floats, its mass is equal to the mass of the displaced water.

Gizmo Warm-up When you place an object in liquid, the downward pull of gravity causes it to start to sink. As the object sinks, the liquid pushes back up on the object with a force that opposes gravity. In the Archimedes' Principle Gizmo™, you will see how these forces cause objects to either sink or float. 1. Check that the Width, Length ...
