In probability theory and statistics, the beta distribution is a family of continuous probability distributions defined on the interval $[0, 1]$ parametrized by two positive shape parameters, denoted by α and β , that appear as exponents of the random variable and control the shape of the distribution. It is a special case of the Dirichlet distribution. ...

In statistics, a bimodal distribution is a continuous probability distribution with two different modes. These appear as distinct peaks (local maxima) in the probability density function, as shown in Figures 1 and 2.. More generally, a multimodal distribution is a continuous probability distribution with two or more modes, as illustrated in Figure 3.

which is known as the Poisson distribution (Papoulis 1984, pp. 101 and 554; Pfeiffer and Schum 1973, p. 200). Note that the sample size has completely dropped out of the probability function, which has the same functional form for all values of μ . The Poisson distribution is implemented in the Wolfram Language as `PoissonDistribution[μ]`.. As expected, the Poisson distribution is normalized so ...

The samples for the two-sample t-test should come from a distribution that's close to normal. This condition is called the assumption of normality. Signs that your data does not come from a normal distribution include skewness or unusually fat tails. You can test for normality in a variety of ways, including visual checks (like box plots or Q-Q-plots) and statistical tests like the Shapiro ...

Hi Lei, You can simply make up the numbers for two samples and run the t test as described on the website to get the solutions. This is a reasonable approach unless you need real data from a real study, in which you could find these by googling, although, as you probably know, there is a lot of work involved to find suitable examples.
