We will introduce major themes in biological physics, with an emphasis on the statistical physics of biological systems at the microscopic or molecular level. Relevant concepts in biology and chemistry are introduced as needed: the course requires no detailed knowledge of biology or chemistry beyond the basic, high-school level.

In the meantime, Nelson's Biological Physics is a useful teaching tool for faculty who are more on the physics end of the interface, while other books—such as those following in the tradition of Charles Cantor and Paul Schimmel's Biophysical Chemistry (W. H. Freeman, 1980), now sadly out of date—will provide teaching material for faculty coming from the more biologically motivated side.

Biological Physics by Philip Nelson manages to connect a physicist to relevant names and problems in biology, and a biologist to the methods and tools of physics. Either task is formidable. Philip Nelson manages it by articulating the contexts nicely, and by employing friendly language and plethora of well-thought examples.

We consider the Bohr correspondence limit of the Schrödinger wave function for an atomic elliptic state. We analyze this limit in the context of Nelson's stochastic mechanics, exposing an underlying deterministic dynamical system in which trajectories converge to Keplerian motion on an ellipse. This solves the long standing problem of obtaining Kepler's laws of planetary motion in a ...

Some recent results on the convergence of Nelson diffusions are extended to the case of Schrödinger operators with time-dependent electromagnet potentials. It is proven that the sequence $\{P_n\}_{n \geq 1}$ of measures on the canonical space of physical trajectories associated to the solutions of Schrödinger equations in Nelson's scheme, corresponding to the sequence $\{(V_n, A_n)\}_{n \geq 1} \subseteq C^1(R; R) \dots$
