Purpose. To understand how sound travels and to discover the difference between transverse and longitudinal waves. Context. Sound is an important concept in science.

### **Properties of Sound Waves - Science NetLinks**

We often hear the question: How big is the amplitude? In our case, it is the "sound amplitude". Usually, we are asking as if there is just "one" amplitude of sound waves in air. The loudness perception of a sound is determined by the amplitude of the sound waves – the higher the amplitude, the louder the sound or the noise.

Answer; Transverse wave; Longitudinal wave; Electromagnetic wave; The standard wave format for any wave is transverse wave. When depicting longitudinal wave in standard wave format, the direction of motion must be rotated by 90 degrees. Only one of two waves is shown at a time when placing electromagnetic wave in standard wave format.

The problem statement asks us to determine the frequency (f) value. From the graphic above, the only means of finding the frequency is to use the wave equation (speed=frequency • wavelength) and knowledge of the speed and wavelength. The speed is given, but wavelength is not known. If the wavelength could be found, then the frequency could be easily calculated.

BODY WAVES --- S AND P WAVES. The fastest wave, and therefore the first to arrive at a given location, is called the P wave. The P wave, or compressional wave, alternately compresses and expands material in the same direction it is traveling. Think of a slinky being compressed.

Sound waves are commonly related to the travel of sound. Sound is technically defined as a mechanical disturbance traveling through an elastic medium. Sound is a mechanical vibration that passes through a medium such as gas, liquid or solid to become a sound. Radio waves are a type of wave that is part of the electromagnetic radiation and it has the longest wavelength on the

Conclusion. Objective and perceived social isolation independently affect the probability of suffering from MDD or GAD whereas loneliness is a risk factor for the deterioration of social life, which highlights the need to address the subjective factors (such as loneliness) and objective factors (such as social network size) of social isolation in a complementary way in order to improve the ...

A cavity is a space enclosed entirely by conducting walls.. If someone inside a cavity creates a disturbance of the EM field, for example by taking a bar magnet and spinning it so that the poles are swapping ends, this radiates EM waves to infinity.
