In mathematical optimization theory, duality or the duality principle is the principle that optimization problems may be viewed from either of two perspectives, the primal problem or the dual problem. The solution to the dual problem provides a lower bound to the solution of the primal (minimization) problem. However in general the optimal values of the primal and dual problems need not be equal.

Convex Optimization Overview (cnt'd)

In mathematics, a duality, generally speaking, translates concepts, theorems or mathematical structures into other concepts, theorems or structures, in a one-to-one fashion, often (but not always) by means of an involution operation: if the dual of A is B, then the dual of B is A. Such involutions sometimes have fixed points, so that the dual of A is A itself.

Deterministic modeling process is presented in the context of linear programs (LP). LP models are easy to solve computationally and have a wide range of applications in diverse fields. This site provides solution algorithms and the needed sensitivity analysis since the solution to a practical problem is not complete with the mere determination of the optimal solution.

Our minds are wired to select and interpret evidence supporting the hypothesis “I’m OK”. A variety of mechanisms: conscious, unconscious, and social direct our attention to ignore the bad and highlight the good to increase our hope and reduce our anxiety. We work hard to retain the belief that “I’m OK” even when faced with significant losses.

Modeling¶. The module cvxopt.modeling can be used to specify and solve optimization problems with convex piecewise-linear objective and constraint functions. Using this modeling tool, one can specify an optimization problem by first defining the optimization variables (see the section Variables), and then specifying the objective and constraint functions using linear operations (vector ...
