Overview. The most basic type of integral equation is called a Fredholm equation of the first type, $= \int (,) ()$.The notation follows Arfken.Here φ is an unknown function, f is a known function, and K is another known function of two variables, often called the kernel function. Note that the limits of integration are constant: this is what characterizes a Fredholm equation.

Bessel functions, first defined by the mathematician Daniel Bernoulli and then generalized by Friedrich Bessel, are the canonical solutions $y(x)$ of Bessel's differential equation $+ + (-) =$ for an arbitrary complex number α, the order of the Bessel function. Although α and $-\alpha$ produce the same differential equation, it is conventional to define different Bessel functions for these two ...

(The factor of in the denominator is present for historical reasons of notation.). The function corresponding to , is the first hypergeometric function to be studied (and, in general, arises the most frequently in physical problems), and so is frequently known as "the" hypergeometric equation or, more explicitly, Gauss's hypergeometric function (Gauss 1812, Barnes 1908).
