A regular polygon is an n-sided polygon in which the sides are all the same length and are symmetrically placed about a common center (i.e., the polygon is both equiangular and equilateral). Only certain regular polygons are "constructible" using the classical Greek tools of the compass and straightedge. The terms equilateral triangle and square refer to the regular 3- and 4-polygons ...

In elementary geometry, a polygon (/ ˈ p ɒ l ɪ g ɒ n /) is a plane figure that is described by a finite number of straight line segments connected to form a closed polygonal chain or polygonal circuit.The solid plane region, the bounding circuit, or the two together, may be called a polygon.. The segments of a polygonal circuit are called its edges or sides, and the points where two edges ...

The above triangular dipyramid has 5 vertices and 9 edges. It's the dual of a triangular prism, and looks like two tetrahedra "glued" on a common face. The pentagonal pyramid has 6 vertices and 10 edges; it's a pyramid whose base is a pentagon. Like all pyramids, the pentagonal pyramid is self-dual. The above three hexahedra are the only ones which exist in a version where all 6 faces are ...

In computational geometry, the point-in-polygon (PIP) problem asks whether a given point in the plane lies inside, outside, or on the boundary of a polygon. It is a special case of point location problems and finds applications in areas that deal with processing geometrical data, such as computer graphics, computer vision, geographical information systems (GIS), motion planning, and CAD.

A pyramidal frustum is a frustum made by chopping the top off a pyramid. It is a special case of a prismatoid. For a right pyramidal frustum, let s be the slant height, h the height, p_1 the bottom base perimeter, p_2 the top base perimeter, A_1 the bottom area, and A_2 the top area. Then the surface area (of the sides) and volume of a pyramidal frustum are given by $S = 1/2(p_1+p_2)s$ (1) $V = 1 ...$
